CRYPTOCURRENCY MARKET OUTLOOK

29 JULY 2025

Dumitrache Andrei

SUMMARY

As we get closer to the end of the current cryptocurrency market cycle, we provide our thoughts and predictions for the final phase of this risk-heavy market using historically accurate technical indicators. Throughout the 4 year market cycle we spent time updating and correcting our theses as we evolved from the bear market in late 2022 to the end of the bull market somewhere during Q4 2025.

We expect to see an end to the current bullish sentiment in the very near future and a continuation of the 4 year cycle into a bearish market in 2026. We will also take note of previous market indicators to assess when is the most profitable time to enter the market again in preparation for the next risk-on cycle.

I. PREVIOUS MARKET OUTLOOKS

As we enter into the late stage of the current market cycle, we aim to look back at previous cycles to get a better understanding of how cryptocurrency projects will evolve in the near future. Over the past several years we have built a strong foundation consisting of indicators and macroeconomic shifts which helped us provide more insightful predictions.

It is important to mention that we do not aim to provide a near-perfect prediction of the market, but we do take into consideration different aspects that could influence its course. For this we take a look at Federal Reserve (FED) shifts towards more lenient policies and their strategies when assessing current balance sheet prospects.

Additionally we look at other macroeconomic factors like inflation, total money supply, asset distribution by class and technical indicators which we will provide an analysis of in the current report.

We start our analysis using the Log BTC Golden Ratio Multiplier which tracks Bitcoin's price evolution closely and provides top signals during exponential growth periods.

Figure 1. Log BTC Golden Ratio Multiplier

We use the Golden Log indicator to assess whether Bitcoin is currently positioned in a normal trend compared to its usual market behavior. We can clearly see that it followed its normal evolution with minor upticks and downtrends throughout the previous cycles. Following this indicator, we can expect an end to the current bull-run and a subsequent cycle top on crypto majors during end of Q3 - beginning of Q4, somewhere around the September - October period.

In past cycles this indicator provided a good analysis on the periods during which Bitcoin was fast approaching its final leg up for the bull run. We aim to use it in a similar manner for this cycle too, with the potential of understanding where the price could be during that time.

We expect that once the top line of the Golden Log pattern has been hit price-wise, Bitcoin will go on for a couple of weeks in its final expansion during this cycle. At that stage we aim to close most of our trades and monitor the indicator continuously to verify its integrity.

Additionally, we use the bottom line of the pattern (200W MA) of this indicator to get a better grasp of the period we should be looking to enter the market again, however we will explore this possibility in subsequent reports.

Our assessment remains cautiously optimistic over the correlation between Bitcoin and this indicator. As long as BTC follows the Golden Log pattern and stays within its ranges we are using it as a buy and sell indicator. As of today, it shows us that we can expect a cycle top somewhere during the next 3 to 5 months, according to past market movements. Additionally, we expect a price top on this asset within the more conservative \$140.000 and the more optimistic \$200.000 range.

II. CURRENT PROSPECTS

While constantly changing, Bitcoin along with other major coins - Ethereum and Solana, follow the same pattern seen in previous years. We heavily base our research on historical patterns and shifts and blend them together with other indicators like political and macroeconomic ones.

As we further explore this space we look toward a more relevant indicator, the 200 week moving averages, which has historically shown great correlation with Bitcoin cycle tops.

Figure 2. Bitcoin price against the 200W MA

Combined with other indicators, the 200W MA gives us the Golden Ratio Multiplier which we have explored earlier. However, we believe this to be such a powerful indicator that we would like to discuss it separately from the ranges of the previous indicator.

As mentioned earlier the 200W MA (the low range of the Golden Ratio) shows great resilience when we are looking to enter the market, since it provides historically good returns when used correctly. Additionally, we believe that it could also be deemed as a good indicator for when we should exit the market.

As we can see in the chart above, there is a strong correlation between the 200W MA and the previous cycle top for Bitcoin. Specifically, when the horizontal line from previous market top meets the current price of the 200W MA indicator we are very likely to have a Bitcoin price top for this cycle. This has happened in all the previous Bitcoin cycles (2013, 2017, 2021). We expect this year to be no different to previous years, however we remain cautious since the cryptocurrency market has seen rapid developments in the past years.

According to this indicator, we predict that a cycle top on Bitcoin will occur somewhere between the end of Q3 and middle of Q4 this year, prediction in line with our previous insights derived from the Golden Ratio indicator. Additionally, this indicator also falls in line with the previous one in showing a price range between \$140,000 and \$180,000 for one Bitcoin, with more optimistic outlooks reaching over \$200,000 if the uptrend gains momentum and keeps it throughout the end of the

year. We must note that we do not weigh in heavily on price predictions and we will explore the reason why later in this report.

III. THE PREDICTABILITY OF BITCOIN

In the cryptocurrency industry most projects have very fast development and release cycles which is a phenomenon rarely observed in other industries. These projects evolve in rapid environments and get popular on few (if any) fundamentals. For this reason we are mostly looking to major currencies like Bitcoin for clarity.

Even if it had a violent upbringing, Bitcoin has recently shown steady and predictable growth. We attribute these factors to the creation of the Exchange Traded Funds (ETFs) and to the wide availability of this coin and its future prospects.

Figure 3. Simple BTC Cycle Top Prediction

While it is a simple chart that only shows cycle top, time and price-wise, we would like to note the predictability of Bitcoin in the past two and a half years. We have recently seen predictable growth compared to past Bitcoin years when prices would range aggressively within a couple of months.

We believe these are signs of a healthy macro asset which has high potential of growing further in the following cycles. While in the past the price has gone through violent swings, we now expect to see a standardized price increase in Bitcoin, not eliminating the possibility of sharp declines during bear markets. However, these declines have considerably lost their power as the cycles evolved, therefore we expect

these sharp declines to normalize as the asset enters new investment markets and becomes more predictable.

IV. CONCLUSIONS

The world in which the industry of cryptocurrencies exists is very rapid and sometimes violent, which makes it difficult to predict the future prices these assets. However, we aim to predict the near future prices of these assets using current market conditions and previous historical indicators.

We must note that since this industry is constantly evolving and has just recently begun getting traction it is difficult to accurately predict prices or to time the cycle tops exactly. For this reason alone, we decided to not predict them with too much accuracy, and instead rely on indicators which give us price and time ranges which we could use to enter and exit the markets.

We strongly recommend avoiding the trap of trying to make this an exact science since this industry is constantly evolving, even more now at very fast rates.

Using the technical indicators presented above we predict that Bitcoin will see a steady increase in price (macro-wise) on higher time frames. Additionally, we believe that the heavy price swings will be rather found in other cryptocurrency projects in industries like DeFi, AI and Real World Assets (RWA) than in major currencies like Bitcoin.

As the cycle matures we aim to bring forth additional reports explaining the market conditions and our investment plans for the short and long term timeframes.
